## EE 4770

Homework 4

Due: 23 April 1999

**Problem 1:** The tasks in the table below run on a system with a non-task preemptive OS with a quantum of 20 ms. Task A does IO after each 10 ms of computation, the IO takes 7 ms to complete. Show CPU activity and task states until the last task finishes.

Task	Priority	Arrival	$\operatorname{Run}$	Activity
Name		Time	Time	
А	3	$10\mathrm{ms}$	$50\mathrm{ms}$	IO each $10 \mathrm{ms}$ takes $7 \mathrm{ms}$ .
В	2	$20\mathrm{ms}$	$70\mathrm{ms}$	
С	1	0	$15\mathrm{ms}$	

**Problem 2:** Information about events and their handlers appear in the table below. Under the one-shot assumption, find the worst case latency and response time for each event. Show the event sequences used.

Event	$\operatorname{Strong}$	Weak	$\operatorname{Run}$
Name	Priority	Priority	Time
A	2	3	$2\mu { m s}$
В	2	2	$5\mu{ m s}$
С	2	1	$10\mu{ m s}$
D	3	1	$6\mu{ m s}$
Е	1	1	$11\mu s$

**Problem 3:** Information about events and their handlers appear in the table below. For each event find: load, load set, loading factor, loaded duration, worst-case latency, and worst-case response time. Show the event sequences used. Find the total load on the system.

Event	Strong	Weak	Run	Occurrence
Name	Priority	Priority	Time	
А	4	2	$5\mu{ m s}$	Periodic, $t_{\rm b} = 10 \mu {\rm s.}$
В	4	1	$1\mu{ m s}$	Periodic, $t_{\rm b} = 3\mu {\rm s}$ .
С	3	1	$2.5\mu{ m s}$	Periodic, $t_{\rm b} = 50 \mu {\rm s.}$
D	2	1	$7\mathrm{ms}$	Periodic, $t_{\rm b} = 75 \mathrm{ms}$ .
Ε	1	1	$8\mathrm{ms}$	500 ms after last response.
