17-11	Static Scheduling	17-11	17-12 Static Scheduling Method	17-12
Idea: determine Static schedule Plan schedule s Result: Table of handler Table covers a p OS starts handle Major cycle desig	e run times in advance. is non-reactive (not reacting to external event). to that preemption not necessary (maybe not possible). start times. priod of time called a <i>major cycle</i> . rs based on table. gned to repeat.		Express periods as integers. (Possibly clock ticks.) Set table length to least-common multiple (LCM) of periods. <sup>1</sup> Put handler start times in table so that deadlines met. If LCM of periods too large then, if possible, adjust periods or use dynamic scheduling. <sup>1</sup> The LCM of a set of integers is the smallest integer that is a positive multiple of all the integers. For example, LCM{10, 15, 20} = $6 \times 10 + 4 \times 15 + 3 \times 20$ .	-

17-13	Deadlines and Static Scheduling	17-13	17-14	Static Scheduling Example	17-14
17-13 I N F e  F II  T 	Deadlines and Static Scheduling Deadline in a dynamically scheduled system based on event time. No explicit event time in static system. For problems in class use an assumed event time: went e with period $t_b(e)$ will occur with period $t_b(e) \dots$ $\ldots$ but with whatever phase needed to ensure that deadlines met. For example, let $t_b(A) = 10 \mu$ s. $t$ might occur at $t = 0, 10 \mu$ s, $20 \mu$ s, $\ldots$ or $t = 1, 11 \mu$ s, $21 \mu$ s, $\ldots$ $\ldots$ or any other phase that would allow deadlines to be met. This timing assumption <b>is not</b> applied to dynamically scheduled systems $\ldots$ $\ldots$ because they <i>can</i> react to external events.	17-13	17-14 Compute a st LCM = 30, s Table:	Static Scheduling Exampletatic schedule for the following system:EventHandlerEventNameRun TimePeriod $\overline{A}$ $4\mu s$ $10\mu s$ $\overline{B}$ $3\mu s$ $15\mu s$ $\overline{C}$ $5\mu s$ $30\mu s$ to table covers $30 \mu s$ .TimeAction $\overline{0\mu s}$ Start A $4\mu s$ Start B $10\mu s$ Start A $17\mu s$ Start B ( $2\mu s$ early) $20\mu s$ Start A $24\mu s$ Start C	17-14

17-1	7 Cyclic Executive Bins	17-17	17-18	Cyclic Executive Design	17-18
Bin Timing			No special method. Use guidelines below.		
Bin starts at fixed interval. (Based on OS timer).			Minor cycle:		
Execution of bin called <i>minor cycle</i> .			Typically of fixed size (which must divide major cycle).		
Time between bin starts also called <i>minor cycle</i> .			Longer than longest handler. (May need to divide handlers into parts.)		
	Different bins may run in consecutive minor cycles, some may repeat.		Try to set minor cycle to greatest common divisor of longer periods.		
	For example: $\mathcal{B}_1, \mathcal{B}_2, \mathcal{B}_1, \mathcal{B}_3$ (note that $\mathcal{B}_1$ used twice.)		If major cycle chosen correctly, minor cycle multiple of shorter periods.		
	Time period in which sequence repeats called a major cycle (as with static schedule).

17-1	9 Cyclic Executive Tradeoffs	17-19	17-20	Cyclic Executive Example	17-20
	Adventores of Cuslic Executive		Cot up a ou	lie ensuiting for the nume remindie sugerts described in table below.	
	Excise to accure timing then dynamic scheduling				
	<ul> <li>Easier to assure timing than dynamic scieduling.</li> <li>Fourier intermunts on other scheduler actions needed than ardinary static schedul.</li> </ul>			Event Handler Event Name Run Time Period	
	• rewer interrupts of other scheduler actions needed than ordinary static schedul- ing.			$\begin{array}{ccc} \mathrm{A} & 4\mu\mathrm{s} & 10\mu\mathrm{s} \\ \mathrm{B} & 3\mu\mathrm{s} & 15\mu\mathrm{s} \end{array}$	
	Disadvantages of Cyclic Executive			C $5\mu s$ $30\mu s$	
	Not useful when periods vary widely. ( <i>E.g.</i> , $1 \mu$ s, $3 \mathrm{ms.}$ ).		Set major c	ycle to $30 \mu s$ , set minor cycle to $15 \mu s$ .	
Not reactive, must assume phase of periodic events.			$\mathcal{B}_1 = (A, B,$	A) and $\mathcal{B}_2 = (B, A, C)$ .	
	Difficult to achieve exact start times for all handlers. ( <i>E.g.</i> , when bin has more than one handler.)		The timing Event $A: t =$	above would meet deadlines if the events occurred in the following way: $-3 \mu s, 7 \mu s, 17 \mu s, 27 \mu s, \dots$	
	Cannot be used with non-periodic events.		Event $B: t =$	$0\mu\mathrm{s}, 15\mu\mathrm{s}, 30\mu\mathrm{s}, \ldots$	
	Cannot easily be used with long running handlers.		Event $C$ : $t =$	$22\mu\mathrm{s}, 52\mu\mathrm{s}, \ldots$
