An Exploration of Visual Computing

Tim McGraw

West Virginia University

Abstract—The fields of computer graphics, image processing and computer vision are inherently intertwined. Solutions to problems in one field are often influenced by methods from another. In this talk I will present examples of the blurring boundaries between the 3 fields which I have encountered while solving problems in medical visualization and information visualization, and during the development of interactive graphics applications.

When: Friday, **29 April 2011,** 11:00 - 12:00
Where: **Room 338 Johnston Hall**
